

Open-E Introduces New Line of iSCSI Software. (6/28)

“Open-E GmbH, the software developer in Network Attached Storage (NAS) provisioning pre-installed software that combines advanced storage management with cost-effective systems, ...announced that the company is ... introducing a complete new line of Open-E iSCSI products for building cost-effective, high performing iSCSI Target systems. The Open-E iSCSI software is the perfect solution for multi-workstation facilities that need significantly more I/O throughput, but do not have the resources for a Fibre Channel SAN. The Open-E iSCSI software makes SANs (Storage Area Networks) available to small- and medium-size businesses by using inexpensive Ethernet adapters and switches to transfer data. ... The key benefit of Open-E iSCSI software is that it enables multiple Windows, Linux, Unix and OS X workstations to store the data on an iSCSI network without the overhead of protocols like SMB, FTP or AppleTalk. This enables clients to use the native file system of their operating system instead. Open-E iSCSI makes it easy for administrators to control and manage storage resources and clients' volume mounts. Through an authentication mechanism, administrators can easily change and delegate access to volume sets or individual volumes to the specified client. The Open-E iSCSI SOHO and Open-E iSCSI SMB are available immediately. The Enterprise version will be released in July.”
